

Annual Water Quality Report 2013

Wildwood Water Service Area

Lake County Illinois Department of Public Works

Purpose and Background

This is the annual water quality report (or consumer confidence report) for the period of January 1 to December 31, 2012. Each year we will issue this report to provide information about the quality of our drinking water as well as details on the source of our water and what it contains. The reports are being issued in compliance with the requirements of the Safe Drinking Water Act and are also intended to demonstrate our commitment to providing a safe and reliable supply of drinking water.

Water Quality

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the US Environmental Protection Agency's (USEPA) Safe Drinking Water Hotline at 1-800-426-4791.

To ensure that tap water is safe to drink, the Environmental Protection Agency prescribes limits on the amount of certain contaminants in water provided by public water systems. Food and Drug Administration (FDA) regulations establish limits for contaminants in bottled water, which must provide the same protection for public health. Your tap water quality is consistently monitored by the County and by the Illinois Environmental Protection Agency (IEPA).

Water quality is judged by comparing your water to USEPA benchmarks for water quality. One such benchmark is called the Maximum Contaminant Level Goal (MCLG). The MCLG is the level of a contaminant in drinking water below which there is no known or expected risk to health. This goal allows for a margin of safety. Another benchmark is a Maximum Contaminant Level (MCL). An MCL is the highest level of a contaminant that is allowed in drinking water. An MCL is set as close to an MCLG as feasible using the best available treatment technology. The MCL and MCLG are established by the USEPA.

Questions?

Public Participation... If you have any questions about this report or about your water system please contact Austin McFarlane at 847-377-7500 or by email to amcfarlane@lakecountyil.gov. You may also visit the Lake County website at www.lakecountyil.gov to learn about opportunities for public participation at County Board meetings where decisions are made that affect drinking water quality. We always like to hear from our customers.

The Water Source, Treatment and Delivery System

Your community is served by Lake Michigan water supplied by the Central Lake County Joint Action Water Agency (CLCJAWA).

CLCJAWA treats and supplies more than 370 million gallons of water to 4,200 customers in Wildwood last year. The delivery system includes 46 miles of water main, one water tower, and two storage reservoirs holding 1.6 million gallons, or two times our daily demand. As added reliability in an emergency, a well water system is available as a back up to the Lake Michigan supply.

Water treated by CLCJAWA at the Paul M. Neal Water Treatment Facility in Lake Bluff is pumped from Lake Michigan and then undergoes a treatment process designed to assure constant contaminant removal and production of clean, safe drinking water that is also aesthetically pleasing. There are two primary features of the treatment process that provide unique capabilities. First, water from Lake Michigan goes through a primary disinfecting step using ozone, which has been found to be highly effective in removing contaminants and in deactivating disease-causing pathogens. And, finally, the treated water passes through filters of granular activated carbon which remove any remaining contaminants and particles from the water and have also proven to be proficient in eliminating problems sometimes encountered with unpleasant tastes or odors.

En Español

Este es un reporte importante sobre la calidad de su agua. Si usted no cuenta con alguien que pueda traducirle este reporte, llame al Lake County Department of Public Works al 847-377-7500 y con mucho gusto le asistiremos.

Annual Water Quality Report 2013

Wildwood Water Service Area

Contaminants Detected

Compound (Units)	Level Detected	Range of Detection	MCLG	MCL	Violation	Sample Date*	Probable Compound Source
Alpha Emitters (pCi/l)	2.6	Single Sample	0	5	N	2008	Erosion of natural deposits.
Barium (ppm)	0.0197	Single Sample	2	2	N	7/5/2012	Erosion of natural deposits.
Beta/Photon Emitters (mrem/yr)**	3.90	Single Sample	0	50	N	11/12/2008	Erosion of natural deposits.
Bromate (ppb)	1	< 1-3.7	0	10	N	7/4/2012	By-product of disinfection.
Chlorine (ppm)	1.2	0.1-1.2	MRDLG = 4	MRDL = 4	N	2012	Disinfectant used to eliminate bacteria.
Combined Radium (226/228) (pci/l)	1.6	0.88-1.6	0	5	N	2008-2012	Erosion of natural deposits.
Fluoride (ppm)	1.03	0.86-1.03	4	4	N	2012	Added for dental health.
Nitrate (mg/L) as Nitrogen	0.447	0.447-0.447	10	10	N	4/2/2012	Naturally occurring .
Sodium (ppm) ***	8.0	Single Sample	n/a	n/a	N	7/5/2012	Erosion of natural deposits.
Total Haloacetic Acids (ppb)	11.9	1.77-11.9	n/a	60	N	2012	By-product of drinking water chlorination.
Total Trihalomethanes (ppb)	22.9	7.43-22.9	n/a	80.0	N	2012	By-product of drinking water chlorination.
Turbidity (% acceptable)	100%	100%	None	0.3 TT	N	2012	Lake sediment, soil runoff.
Turbidity (NTU)	0.09	0.02-0.09	None	1 TT	N	2012	Lake sediment, soil runoff.

* Some contaminants are sampled less frequently than once a year; as a result, not all contaminants were sampled for during the CCR calendar year. If any of these contaminants were detected the last time they were sampled for, they are included in the table along with the date that the detection occurred.

** There is not a state or federal MCL for sodium and sulfate. Sodium Monitoring is required to provide information to consumers and health officials that are concerned about sodium intake due to dietary precautions.

Abbreviation	Definition
AL	Action Level is the concentration of a contaminant which, if exceeded, triggers treatment or other requirements.
MCL	Maximum Contaminant Level is the highest level of a contaminant that is allowed in drinking water.
MCLG	Maximum Contaminant Level Goal is the contaminant level below which there is no known or expected health risk.
n/a	Not Applicable
MRDL	The highest level of a disinfectant allowed in drinking water.
MRDLG	The level of a drinking water disinfectant below which there is no known or expected risk to health.
NTU	Nephelometric Turbidity Units is a measure of water clarity.
pCi/L	pico Curies per liter.
pos/month	The maximum number of positive samples collected in a calendar month.
ppb	Parts-per-billion is also referred to as micrograms per liter (µg/L). Equivalent to one ounce in 7,812,500 gallons of water.
ppm	Parts-per-million is also referred to as milligrams per liter (mg/L). Equivalent to one ounce in 7,812 gallons of water.
TT	Treatment Technique refers to a required process intended to reduce contaminant levels in drinking water.

Important Health Information

Some people may be more vulnerable to contaminants in drinking water than the general population. *Immuno-compromised* persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. The USEPA and Center for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the USEPA Safe Drinking Water Hotline at 1-800-426-4791.

Contaminant Sources in Drinking Water

Both tap and bottled water come from rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of land or through the ground, it dissolves naturally occurring minerals and can pick up substances resulting from the presence of animal or human activity. Contaminants that may be present in untreated water include:

- Microbial contaminants such as viruses and bacteria can be naturally occurring or may come from sewage treatment plants, septic systems and live stock operations.
- Inorganic contaminants such as salts and metals can be naturally occurring or can result from urban storm water runoff, wastewater discharges, oil or gas production, mining, or farming.
- Pesticides and herbicides come from sources such as agricultural and residential storm water runoff.
- Organic chemical contaminants including synthetic and volatile organic compounds are by-products of industrial processes and petroleum production but can also come from gas stations, urban storm water runoff and septic systems.
- Radioactive contaminants can be naturally occurring or be the result of oil and gas production and mining activities.

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Lake County Public Works is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information about lead in drinking water, testing methods, and steps to minimize exposure is available from the Safe Drinking Water Hotline at 1-800-426-4791 or at <http://www.epa.gov/safewater/lead>.

Lead and Copper

Compound (Units)	90th Percentile	# of Sites Over Action Level	MCLG	Action Level	Sample Date*	Probable Compound Source
Copper (ppm)	0.190	0	1.3	1.3	2011	Erosion of natural deposits; Corrosion of household plumbing.
Lead (ppb)	5.6	0	0	15	2011	Erosion of natural deposits; Corrosion of household plumbing.

Violation Type	Violation Begin	Violation End	Violation Table Explanation
CCR Adequacy/ Availability/ Content	7/1/2012	4/19/2013	The Annual Water Quality Report provided to you in 2012 by Lake County did not include the Source Water Assessment prepared by the IEPA, which is intended to inform you of the risks from exposure to contaminants detected in our water. The 2013 Water Quality Report does include this information.

Source Water Assessment

Susceptibility is defined as the likelihood for the source water(s) of a public water system to be contaminated at concentrations that would pose a concern. The Illinois EPA considers all surface water sources of a community water supply to be susceptible to potential pollution problems. The very nature of surface water allows contaminants to migrate into the intake with no protection only dilution, which is the reason for mandatory treatment for all surface water supplies in Illinois. CLCJAWA's intake is moderately sensitive to potential pollution, although there are no potential sources within the intake's critical assessment zone, and there are several within the immediate source water area. While the shoreline contaminants are not perceived as an immediate threat, the combination of the land use, storm sewer outfalls and the proximity of NSSD pumping stations add to the susceptibility of CLCJAWA's intake. However, it should be stressed that treatment employed by CLCJAWA CWS is protective of their consumers as noted by the facility's finished water history.
